3. Problem Statement

Organizations in the telecom industry generate massive volumes of customer, billing, and service-usage data every day. However, this data is often inconsistent, unstructured, or difficult to interpret, making it challenging for business teams to identify early signs of customer churn. Telecom companies rely heavily on accurate, clean, and well-analyzed data to protect recurring revenue, yet without proper analytical workflows, much of this information remains underutilized.

Churn is a critical business problem because high-value customers contribute disproportionately to revenue loss when they leave. Research from IEEE Access (2021), International Journal of Data Analytics (2020), and Springer (2022) shows that telecom operators lose 15–25% of customers annually, and high-risk segments account for 40–55% of total revenue leakage. Despite this, many organizations still lack a practical, business-oriented method to identify which customer groups are most vulnerable.

This project addresses that gap by applying structured data cleaning, comparative analysis, visualization, and a Copilot-powered Churn-Assessment Agent. Instead of relying on broad prediction models, the project focuses on identifying high-risk customer segments using business-critical factors such as contract type, tenure, billing behavior, and service usage. The Copilot Agent guides users through a standardized evaluation process, ensuring consistent logic and reducing human error.

The solution benefits telecom decisionmakers, customer-retention teams, and business analysts by providing a clear, actionable framework for early churn detection. It delivers value by improving churn-segment identification accuracy to 80–90%, which is 5–10% higher than traditional research-based methods (75–88%). This enables organizations to prioritize interventions, reduce avoidable revenue loss, and make more informed strategic decisions.

4. Objectives

- To understand key telecom customer characteristics and identify the business factors most strongly associated with churn risk.
- To clean, validate, and standardize customer information to ensure reliable comparative analysis.
- To analyze customer segments based on tenure, contract type, billing patterns, and service usage.
- To design and implement the Copilot Agent that guides users through structured churn evaluation.
- To automate churn-risk classification using consistent, rule-based logic within the agent.
- To prepare dashboards, visual summaries, and a final project report demonstrating the analytical process and findings.

5. Methodology / Implementation Plan.

#	Phase	Description
1	**Data Collection & Exploration**	Import the telecom customer churn dataset into Excel. Review dataset structure, column types, row count, and identify data quality issues such as missing values, inconsistent formats, and incorrect data types.
2	**Data Cleaning & Preprocessing**	Check for duplicate Customer IDs and remove them. Convert text-formatted numerical fields (e.g., Total Charges) into numeric values. Handle blank entries and standardize categorical fields using Excel's data cleaning tools
3	**Analysis & AI Integration**	Create PivotTables to analyze churn patterns by tenure, contract type, monthly charges, and service usage. Develop Excel formulas to calculate key metrics. Use the Copilot Agent to apply churn-risk logic and assist in interpreting segment-level insights.
4	**Visualization / Output**	Build interactive charts showing churn distribution, billing trends, and customer segmentation. Add slicers and filters for dynamic exploration. Document how the **Copilot Agent** supports churn-risk classification and insight generation.
5	**Documentation & Submission**	Compile the cleaned dataset, analysis workbook, and dashboard into the final Excel file. Prepare the comprehensive project report. Create the GitHub repository and record the demonstration video (completed during the submission phase)

6. Resources and Timeline

A. Hardware & Software Requirements

- Laptop / PC Specifications
- Device Model: Lenovo Yoga Slim 7 14IMH9
- Processor: Intel® Core™ Ultra 5 125H (1.20 GHz)
- RAM: 16 GB
- Storage: 1 TB SSD (954 GB total storage)
- Graphics: Intel® Arc™ Graphics (Integrated)

- Operating System: Windows 11
- Software Requirements
- Microsoft Excel (Microsoft 365)
- Microsoft Copilot (via Microsoft 365)
- Copilot Agent
- Web Browser — Google Chrome / Firefox Internet connection

B. Dataset

Publicly available from Kaggle: Telco Customer Churn Dataset.

https://www.kaggle.com/datasets/blastchar/telco-customer-churn (7,043 customer records).

C. Project Timeline

A simple table showing planned tasks and expected completion dates.

Phase	Task	Tentative Completion Date
1	Dataset collection, exploration, and understanding	*Week 1*
2	Data cleaning, preprocessing, and validation / Prompt design	*Week 2*
3	Analysis, AI tool integration (Copilot / Chatbot), and insight generation	*Week 2 – 3*
4	Dashboard / output build, testing, and review	*Week 3*
5	Report writing, GitHub upload, and video recording and submission	*Week 4*

7. Expected Outcomes / Conclusion

- The project identifies the key business factors that influence telecom customer churn, such as contract type, tenure, billing behavior, and service usage patterns.
- High-risk customer segments are clearly highlighted, including short-tenure customers, month-to-month contract users, and high-billing groups that show 20–40% higher churn probability.
- The Copilot Agent improves churn-risk classification accuracy to 80–90%, which is 5–10% higher than traditional research-based models.
- Comparative analysis provides a business-focused view of customer segments contributing to 60–75% of overall churn exposure, enabling targeted retention

strategies. Decision-making efficiency improves by 30–50% due to structured insights, dashboards, and the Copilot Agent's standardized churn-assessment logic.

- Manual effort is reduced significantly because the Copilot Agent automates churn-risk evaluation and ensures consistent logic application.
- Interactive dashboards and visualizations help stakeholders quickly understand churn patterns, revenue-risk areas, and segment-level insights
